8/0020/64/155/004/0937/0939

AUTHOR: Zavil'gel'skiy, G. B.; Il'yashenko, B. N.; Minyat, E. Ye. Rudchenko, O. N.

TITLE: Protective action of acridine orange against ultraviolet irradiation of DNA-infected bacteriophage 1 sub Phi 7

SOURCE: AN SSSR. Doklady*, v. 155, no. 4, 1964, 937-939

TOPIC TAGS: bacteria destroyer, bacteriophage, phage, bacteriolytic agent, acridine orange, DNA, desoxyribonucleic acid, deoxyribonucleic acid, biochemical research, physiological research, TNA, spheroplast

ABSTRACT: In the interaction of the basic dye acridine orange (AO) with DNA two complexes are formed: complex I, probably consisting of AO dimers or higher aggregates and complex II is an AO monomer. Complex I is mostly formed with single-chain DNA and RNA, while complex II is formed with native double-chain DNA. The purpose of the present work was to find whether AO can be used as protective substance against inactivation of infectious DNA by UV radiation. In the tests, DNA of the intestinal phage 1 ϕ 7 was used. DNA isolated from 1 ϕ 7 is infectious for spheroplast bacteria. DNA separation was done according to the phenolic

Card 1/3

ACCESSION NR: AP4030793

method. Spheroplasts were prepared from a broth culture of E.coli C. An elaborate test showed that dyeing of infectious DNA with AO in a $5 \cdot 10^{-7}M$ concentration caused practically no screening of UV light. The same test was repeated with λ 7 bacterio. phage. AO dye has no effect on the whole phage (DNA + albumin skin) since it does not penetrate through the albumin skin. Neither does UV radiation. With increased AO concentrations, the quanta input of lethal UV action decreases ($5 \cdot 10^{-7} = 1.6x$; $2.5 \cdot 10^{-6} = 2.85x$; $5 \cdot 10^{-6} = 4.8x$). The tests showed that in a DNA solution dyed with AO and irradiated with UV light (of the nucleic acid absorption spectrum), the dye protects DNA from inactivation by the UV quanta. This means an effective energy migration from the DNA base to the dye with subsequent light output or heat conversion. Orig. art. has: 1 figure, no formulas, no tables.

INACTIVATING AND MUTAGENIC ACTION OF UV RAYS ON EXTRACELLULAR BACTERIOPHAGES

1965, 700-713

INSTITUT OF MICROBIOLOGY AND BIOPHYSICS, ACADEMY OF SCIENCES, USSR (Institute of Microbiology and Biophysics, Academy of Sciences, USSR)

Effect of inactivating and mutagenic action of UV rays on extracellular bacteriophages

SOURCE: AN SSSR. Izvestiya. Seriya biologicheskaya, no. 5, 1965, 700-713

TOPIC TAGS: UV ray, bacteriophage, ~~phage~~, mutagenic effect, phage inactivation

ABSTRACT: The effect of UV rays on the infectivity of bacteriophages was tested on the phage T4.

The results show that the infectivity of the phage is inactivated by UV rays in a dose-dependent manner.

The results also show that the infectivity of the phage is not inactivated by UV rays in a dose-dependent manner.

Card 1, 2

by shading or protection from UV irradiation, multiple reactivation, reactivation by the host, or by genetic or phenotypic heterogeneity of population. The observed decrease in mutation frequency is not related to increased sensitivity of mutants, reversions, or suppressor mutations. Possible explanations of the observed phenomena are based on the following: phage DNA has noncritical areas, the possibility of energy migration between bases of two-spiral DNA, and disruption of damage in the phage.

AUTHORS: Andrianov, K. A., Severnyy, V. V., and Zavin, B. G.

TITLE: Telomerization reaction of dimethyl cyclosilanes.
Communication I. Production of linear α,ω -dichloro-
dimethyl siloxanes

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniya khimicheskikh
nauk, no. 8, 1961, 1456-1461

TEXT: The authors investigated the telomerization of hexamethyl-cyclo-
trisiloxane and octamethyl-cyclotetrasiloxane with dimethyl-di-chloro-
silane, as well as the effect of the ratio of octamethyl-cyclotetra-
siloxane to dimethyl-dichlorosilane on the composition of the reaction
products. The following were used for the synthesis: crystalline
hexamethyl-cyclotrisiloxane, melting point 62-64°C, boiling point
132-136°C; octamethyl-cyclotetrasiloxane, boiling point 174-176°C;
dimethyl-dichlorosilane with a chlorine content of 55.7 %. The reaction
was found to proceed according to

Telomerization reaction of dimethyl...

methyl siloxanes showed that conformable to law boiling points, specific gravities and refractive indices change with the number of silicon atoms in the molecule. No anomalies are observed in this connection. The telomerization of octamethyl-cyclotetrasiloxane with dimethyl-dichlorosilane was investigated at different molar ratios of the components: 1:1, 2:1 and 3:1. Experiments showed (Fig. 3) that telomerization does not yield pure products for any of the ratios investigated. Telomer mixtures with maximum yield of the product corresponding to the ratio concerned, develop continually. When increasing the ratio of the reacting components, the yield of low telomers is reduced and the amount of high-boiling products is greatly increased. There are 3 figures, 5 tables, and 2 references: 1 Soviet and 1 non-Soviet. The reference to the English-language publication reads as follows: W. Patnode, D. Wilcock, J. Amer. Chem. TITLE: Telomerization of dimethyl cyclosiloxane derivatives. II.
Preparation of straight-chain α -chloro- ω -trimethyl-siloxy-
dimethyl siloxanes

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye khimicheskikh
nauk, no. 9, 1961, 1610-1615

TEXT: The reaction of octamethyl cyclotetrasiloxane with trimethyl-chloro
silane is described. It was shown in previous experiments (Ref. 2: DAN
SSSR, 134, no. 6, 1347 (1960); Ref. 3: Izv. AN. Otd. khim. n. 1961,
no. 8) that the reaction of dimethyl-dichloro silane with dimethyl
cyclosiloxanes yields a series of α, ω -dichloro-dimethyl siloxanes of the
structure

Card 1/4

27490

S/062/61/000/009/005/014
B117/B101

Telomerization of dimethyl ...

where m denotes the number of silicon atoms in the initial ring, $n = 1, 2, 3$ etc. In this study, the monofunctional trimethyl-chloro silane and not a difunctional compound was used as chain-terminating substance for the telomerization of dimethyl cyclotrasiloxanes. Equimolar amounts of octamethyl cyclotetrasiloxane and trimethyl-chloro silane telomerize in an autoclave at 250°C within 5 hr according to the scheme

Pure telomers with $n = 2, 3$, and 4 were obtained from the reaction mixture by fractional distillation. The physical constants of the telomers are listed in Table 1. The physical properties exhibit no anomalies. Tests carried out with various molar ratios of octamethyl cyclotetrasiloxane to trimethyl-chloro silane showed that at ratios of 1 : 1, 2 : 1, and 3 : 1 mixtures of telomers only, and no pure compounds were formed. In all of these mixtures the telomer formed in maximum quantity did not correspond to the stoichiometric ratio of the reactants. The telomer having a chain by 4 dimethyl-siloxane units longer than would correspond to the

Card 2/4

Telomerization of dimethyl ...

27490
S/062/61/000/009/005/014
B117/B101

stoichiometric ratio of the initial mixture was observed to form in maximum yield. An increase of the octamethyl cyclotetrasiloxane : Trimethyl-chloro silane ratio lowers the yield of the lowest telomers, and highly increases the yield of high-boiling products. Within the range of molar ratios studied, lower trimethyl-chloro silane contents in the initial mixture did not decrease the conversion of octamethyl cyclotetrasiloxane. There are 2 figures, 6 tables, and 4 references: 2 Soviet and 2 non-Soviet. The reference to the English-language publication reads as follows: D. Wilcock, J. Amer. Chem. Soc. 68, 692 (1946).

TITLE: Visual and Photographic Observations of Mars During the Period of the Great Opposition of 1956

PERIODICAL: Astron. tsirkulyar, 1958, Jan 11, Nr 188, pp 13 - 14

ABSTRACT: The visual observations of Mars were carried out from September 5 to October 15, 1956, by a 16" refractor of the Abastumani Observatory with a magnification of 272X through red, yellow, green and blue light-filters and without light-filters. The transparency of Mars's atmosphere remained poor from September 5 to 29, 1956. A bright golden ring was observed around the disk, while the contrast degree of the seas was diminished. Light cloud formations were not observed in the atmosphere, only on October 8 a longitudinal band of about the same brightness as the polar cap was visible. On the continents bright regions were observed repeatedly. The Hellas region was especially bright on October 9 and 15. Without the filters the seas seemed grey in September and blue-green in October. On October 9 three parallel lines of canals were distinguishable, which stretched from the South polar

cover to the Northern side of the Eritrean sea. The South polar cap appeared on September 8 and grew till September 17; towards the middle of October it decreased. A dark rim around the South polar cap in red rays seemed fainter than the seas, and in green and blue ones more pronounced than the seas. The photographs taken of the planet in various sections of the spectrum have been processed. The study of the measurement along the equatorial and polar diameters has shown that for photographic rays the distribution of brightness is more uniform than for visual ones. The photometric analysis of the Eastern edge of the disk disclosed in the terminator (angle of the phase was 22°) two clouds: The Southern one in the latitude of 45° - 60° , the Northern one in the latitude of 45° .
